If you are **unable to see any servers on the subnet** you will need to specify the license server by setting an environment variable pointing to server's name or IP address (Rainbow recommends the IP address):

   * On Windows NT, 2000 and XP:

   1. Open the Control Panel and then open System.

   2. Click on the Advanced tab and click on Environment Variables.

   3. Click on New and use:
   - LSFORCEHOST for the Variable name, and,
   - The servername or the serverIPaddress for the Variable value.

   4. Click OK to save.

New System Variable

Variable name: LSFORCEHOST

Variable value: 123.45.67.890

[OK] [Cancel]

5. Open the command prompt and type SET, followed by Enter.

6. You should see a line something like:
SET LSFORCEHOST=SERVERNAME, where
SERVERNAME is the server name or IP address specific for
your setup.

```
C:\WINDOWS\system32\cmd.exe
